(57) **ABSTRACT**

The present invention relates to a method for the ventilation
of a living being (3), the respiration airflow (v) flowing into
the living being (3) and out of the living being (3) being
detected, it being ascertained from the detected respiration
airflow (v) whether an inhalation phase or an exhalation
phase is present, and the air pressure (p) in a respiratory
organ of the living being (3) being regulated, characterized
in that, upon recognition of an inhalation phase, the air
pressure (p) in the respiratory organ is raised at the begin-
ning of the inhalation phase and lowered again with pro-
gressing respiration cycle.
